thank you Simon for the suggestion. The new worldfactbook file has more than 200 columns and reshuffling used to be indeed very cumbersome. I have added a new item in the popup menu on the table view's title bar: 'Change Column Order...'. This opens a dialog with a list of all displayable column names, which can be rearranged with drag&drop. Another rather new functionality also helps in handling many columns: the definition of column groups, which can be used to temporarily show only columns that belong to a specific group. In addition the column filter (spy glass) now allows to use ',' to separate multiple entries and it allows defining a regex, when the column filter input starts with 'regex:'.

These changes are downloadable now as dev update from the download page. Download links are in the small print after accepting the 'Read and understood' checkbox.

Thomas
