---

After orientating a given 3D molecule in the 3D viewer, is it then possible to fix this orientation and have the rest of the molecules use it as well?

My scenario is that I often look at compounds that have been docked, and so they have the protein as the common reference frame and these are the 3D coordinates that are imported into DW. In essence, they have the alignment I want, I simply want to reorientate the 3D view and have it unchanged as I scroll through the molecules.

Scott
