When dealing with large tables of data, it is easy to lose sight of what you are looking at.

I would be wonderful if it was possible to freeze the first couple of columns in a data table which will typically contain the Molecule ID and the structure, so that when you are scrolling off to the right, you can easily keep track of what molecule the data corresponds too.

Thanks,

Simon.

this is not very easy to implement, because the JTable, which is Java table standard used in DataWarrior does not support column freezing and because DataWarrior already uses its own extension to show row numbers, which makes things more complicated. Nevertheless, you are not the first to ask, and when I have a little time, I will start experimenting to investigate, whether there is a feasible solution.

Thomas
