If a formula is created in version 5.2.1 and if the formula ends with a new-line character, which easily happens, then the new-line char is not removed when the formula is written into the column properties section of the dwar file.
This causes DataWarrior wrongly to take the "> as header line. If you open your dwar file in a text editor,
put the cursor at the beginning of the "> line, press once the 'delete backwards' button and save, your file
should work again.
The current development version encodes new-lines in formulas, such that is does not happen anymore.
