If a formula is created in version 5.2.1 and if the formula ends with a new-line character, which easily happens, then the new-line char is not removed when the formula is written into the column properties section of the dwar file.

This causes DataWarrior wrongly to take the ">" as header line. If you open your dwar file in a text editor,

put the cursor at the beginning of the ">" line, press once the 'delete backwards' button and save, your file

should work again.

The current development version encodes new-lines in formulas, such that it does not happen anymore.
