Hi Andrew,

for the first part of your question, I would suggest to return to the original unprocessed file (i.e., prior using the group functionality) and start all over again while capturing the actions as a macro (Macro -> Start Recording). Once done, close the recording (Macro -> Stop Recording), and export the macro as a separate file (a .dwam file). If your next .dwar file (x + 1) is organized in the same pattern as the original file (x), you may import this macro, and execute its stored actions again; like a template. Because this works well for recurring computations/assignments; it is worth a try in your case of application.
