Subject: Auto create and disable range filter when null values found

We have a data table from pivot. the columns are dynamic so can not be called by name in a macro. We need a range filter on columns that contain null values. adding 0 to all null values isn't an option because we need to know where there is no data. we can not change data type because we need the range filter. is there anything that can add a range filter for all columns then disable all filters?
