Subject: Re: Hyperlinks that contain a semicolon get split in two
Posted by thomas on Wed, 06 Apr 2022 09:16:41 GMT

This is now fixed. In DataWarrior the String "; " and a '/n' are allowed data separators. The code to separate the string here was too laze and also separated at a single semicolon. Now it is more strict to require at least one SPACE after the semicolon.

In addition, when directly clicking the link in a DataWarrior cell, the content was not URL encoded. Therefore the semicolon caused a problem. Now cell content will be encoded unless the column properties section contains a line like:
<columnProperty="lookupEncode0 false">

The change is deployed in the current dev update.
