Dear Thomas,

For the nicely working «merge by reaction» function, I would like to file for feature suggestion. May one extend the reaction editor's functionality to match the one already present when running chemistry -> enumerate combinatorial library, i.e. to add

- + define .and. save (eventually re-use) a reaction with user defined name in the .rxn format
- + access the already available templates of the combinatorial library (Stille, Wittig, etc.)

By now, the GUI of the two seem to differ:

The observations refer to DW 5.5.0 for Linux including the update by 2022-06-17.

Norwid
