Dear Thomas,

For the nicely working «merge by reaction» function, I would like to file for feature suggestion. May one extend the reaction editor's functionality to match the one already present when running chemistry -> enumerate combinatorial library, i.e. to add

- + define .and. save (eventually re-use) a reaction with user defined name in the .rxn format
- + access the already available templates of the combinatorial library (Stille, Wittig, etc.)

By now, the GUI of the two seem to differ:

The observations refer to DW 5.5.0 for Linux including the update by 2022-06-17.

Norwid

The screenshot shows a software window with a menu bar (File, Edit, Data, Chemistry, Database, List, Macro, Help) and a toolbar. The main area is a table with columns 'amines' and 'chlorides'. The first row is highlighted with a red border. To the right of the table is a 'Data' panel with a table showing the selected row's data.

Column Name	Value
amines	<chem>CCCCN</chem>
chlorides	<chem>CCC(=O)Cl</chem>

At the bottom of the window, it says '302 of 815 MB', 'Selected:1', 'Visible:3', and 'Total:3'.
