Hi Thomas, Thanks for replying. Yes, I was referring to example2.

Currently, the DB contains mol file and SMILES as CLOB and string in the DB, respectively.

I want to do a similiarity search but dont want to get everything from the DB and then filter it. So what I want to do is:

Use Datawarrior or openchemlib.jar to do a similarity search on existing database.

I believe, since datawarrior is a client, it needs all the data from DB to do the similarity search.

Is it possible to achieve the same feature of datawarrior bundled with openchemlib.jar and implement it in an API?
