There is no built in limit, but when starting the Java virtual machine DataWarrior needs to define a
maximum memory size, which for Windows 32-bits is about 1.2 GB, on Windows 64-bits is about
twice as much.
If DataWarrior would define higher values, then Windows would refuse to start DataWarrior at all
on
low memory machines.
For the Macintosh and Linux these values are a little higher and can also be changed easily in the
start-up
script (Linux) or info.plist (Macintosh) depending on the physical memory.
