Not sure if this is a bug or a feature request...

Marker labels in a 2D graph (at least, haven't checked 3D) aren't automatically resized at different zooms. There is the ability to resize the label manually, but if I've been including structures as labels then zoom in to a region of the graph the structures can get really, really big!

It would be great if the label size could be set to a constant, so that zooming didn't change it at all.
