Subject: Jar file from Linux build
Posted by nats on Tue, 11 Oct 2022 01:02:15 GMT

I have downloaded the source code on a linux machine and built the code. The application runs when using buildDataWarrior and runDataWarrior however when replacing the original datawarrior.jar file from the datawarrior_linux installer with the freshly built one it won't run. Is there something I'm doing wrong?

I get a sketchy Data Warrior logo then nothing.

AWS Amazon Linux 2.

Should I be using a different version of linux?
