
Subject: showing variable txt/values at "showMessage" macros

I tried different ways to identify variable txt and/or numeric values in DW macros by showing them using the DW macros "showMessage" to help in the designing of different macro codes.

I ended up experimenting with the simplest following code:

```
<macro name="Savenombre">  
<task name="defineVariable">  
name=filename  
message= type your name, please....  
</task>  
<task name="showMessage">  
message=$filename.txt?????????  
</task>  
</macro>
```

I got being asked and typing the name, but the "showMessage" did not even appeared, no matter what I tried it to type for the message to get the variable text/value (filename, \$filename, name, \$name, ±txt, etc, etc).....

Is there any other way to do it?

thank you

julio
