I noticed that 6.0 treats values like <2 and >10 differently from 5.5
In the old version these were treated as numbers, and a column would be correctly assigned as numeric if it would contain entries like these. Allowing for rounding, colouring scales etc.
Now columns with >2 are interpreted as text, generating errors on all my old macros.
Manually setting the columns to floating point generates errors too (image attached).

EDIT: there seems to be an overarching phenomenon, which is the treatment of spaces (notably the lack thereof) in cells.
'>2' seems to be recognized as text, while
'> 2' is treated as a number.
This was different in 5.5

Likewise, multiple numbers without spaces, are treated as text:
'4.5;4.8' is text, while
'4.5; 4.8' are two consequetive numbers.

Clearly it would be great it this could be backwards compatible to 5.5 again.
