Hi Yuan,

thanks you for the hint. Of course, your suggestion makes a lot of sense. I have update the source code now to offer three options:

- 'remove duplicates', which is similar to the current handling: if the cells to be merged all contain the same value,

- then this value is placed into the merged cell only once. Otherwise we see all entries in original order

- 'keep duplicates', which is your suggested handling: we always see all entries in original order

- 'depend on columns groups', which assumes that related columns, e.g. result columns of one assay, are grouped using

- the column grouping feature. Then it checks, whether all cells of the same column group are equal and only then it

- removes for all these columns the same entry.

In the next version this will go live...

Thomas
