Dear mcmc,

with multiple measurements of one property about one structure record, could 1) creating individual .dwar files (each about one structure record with exactly one measurement of the property of interest) and 2) the subsequent merge of equivalent rows (where multiple measurements in one cell cell are separated by a linefeed) represent a workflow suitable for you? Though I didn't yet use DW in the context of SQL, your question seems to relate to the Yuan's approach documented by May 28th, 2024.[1]

Best regards,

Norwid
