Hi Thomas,

When using "Merge Files" to update existing columns from multiple CSV file

- the column names in the first CSV (Book2.csv) can be automatically matched to existing column names
- the column names in the second (Book3.csv) and more CSV files can not be automatically matched to existing column names.

This issue is annoying when there are a lot of columns in the master DW file. Could you help to solve it?

This issue is found in DW5.5 and 6.04.01 Windows versions.

Attached are a master DW file and two CSV files.
