to be honest, I don't have an idea. It might be a defect installer (msi-file), some other interfering software, but I am clueless. I assume that you tried the current version 4.7.3? Since 4.7.2 DataWarrior for Windows doesn't need any Java runtime pre-installed. A JRE is part of the installer. The side effect is that there is no 32-bit version anymore.

What I could offer you is to send you a current DataWarrior.exe to replace the one of your current installation.

That exe would produce some debugging output if started from the command line. Maybe it works or it gives some clues.

If you like to try this, please let me know.

Thomas
