there is no document that describes the entire file format, but there is open-source code that reads or writes it. In principal the files contains these sections:

- header with version and row count
 - column properties assigning properties to columns identified by names. These include
 - special types like idcode (encoded chemical structure), rxncode (encoded reaction), descriptors
 - parent-child relationships, e.g. to associate a descriptor column to a parent idcode column
 - detail type and access information in case the column contains references to details (images, html code)
 - others
 - the TAB delimited data table itself
 - optionally encoded embedded details
 - optionally encoded row lists
 - optionally embedded macros
 - the datawarrior template, which includes information about open views and filters
-
