There are two answers to it:

- 'Paste into table' used to work with alphanumerical content only. Therefore, structure and reaction cells didn't have the 'Paste into table' item in their popup menus.
- 'Paste into table' is not an 'append to table' functionality. It starts exactly at the cell that is clicked with the mouse to produce the menu. For copying and appending entire rows, you need to add the right number of empty rows, copy all cells of one or more rows (without header) and paste them from the popup menu from the first column of the first empty row.

The current development version now supports copy and paste of reactions and structures if they are part of copied cells that are pasted with 'Paste into table'. This includes 2D- or 3D-coordinates and reaction mapping information, which is now encoded as part of the text information exchanged through the clipboard. If there are 2D- and 3D-atom-coordinates, the 2D-coords are copied.

The update can be downloaded as [openmolecules.org/datawarrior/dw521win.zip](http://openmolecules.org/datawarrior/dw521win.zip) (for Windows) or [openmolecules.org/datawarrior/dw521x.zip](http://openmolecules.org/datawarrior/dw521x.zip) (for Linux and Mac). To update, you need the official V.5.2.1 version to be installed. Then unzip the zip-file and put all files from the zip file into the datawarrior installation folder, where they replace older ones. To be on the safe side, you should keep the old files in case you choose to revert.
