You may open documents with their default applications instead of web pages in a browser with the proper column property. Still the caveat is that these links are not connected to individual cell values, but to the entire row. For that you need a column containing the file names. In the column properties section you define for that column an `openExternalName` value and optionally an `openExternalPath` value (defines the path where to look for the files). The example illustrates how to add document links into a `dwar` file (the white space in the column properties are TABs):

```
<datawarrior-fileinfo>
<version="3.2">
</datawarrior-fileinfo>
<column properties>
<columnName="File-Link">
<columnProperty="openExternalPath /home/thomas/test/">
<columnProperty="openExternalName Explanation-File">
</column properties>
Value File-Link
123; 245 file1.txt; file2.txt
```
