You may open documents with their default applications instead of web pages in a browser with the proper column property. Still the caveat is that these links are not connected to individual cell values, but to the entire row. For that you need a column containing the file names. In the column properties section you define for that column an openExternalName value and optionally an openExternalPath value (defines the path where to look for the files). The example illustrates how to add document links into a dwar file (the white space in the column properties are TABs):

<datawarrior-fileinfo>
<version="3.2">
</datawarrior-fileinfo>
<column properties>
<columnName="File-Link">
<columnProperty="openExternalPath /home/thomas/test/">
<columnProperty="openExternalName Explanation-File">
</columnProperties>
Value File-Link
123; 245 file1.txt; file2.txt
