Is there a way to use compoundID as category value, select several collumns with data and represent them like in a file attached?

yes, with the following data
- create a 2D view with preferred view 'bar chart' with bars representing mean of value
- choose 'CompoundID' and unassigned for the two axes
- set marker color to 'Type'
- separate cases by 'Type'

CompoundID Type Value
ID1 A 12
ID1 B 17
ID1 C 13
ID2 A 14
ID2 B 9
ID2 C 11
ID3 A 8
ID3 B 12
ID3 C 15

this should come close, Thomas

thomas, thank you very much for the reply!
i assume, there should have been done reverse pivoting with my table? i did it. however, i don't really get your instruction in the part of "- choose 'CompoundID'". where should i choose it? obviously not in bar chart settings, as there are only numerical fields available.

sorry for the delay. Press the 'xyz' button in the blue title area of the 2D-view. This opens a popup with comboboxes and sliders to assign columns to axes and to zoom into them, respectively. Select 'CompoundID' on one axis (combobox) and '<unassigned>' on the other. I hope, this explains it...

Thomas
