Subject: Hiding data points and corresponding legend

Hi,

I wondered if it is currently possible, say in a scatter or box plot to also hide the legends for a group of data points when this group is hidden (i.e. deselected for visualization).

Let's say I have 10 groups of data, and I color the data points by group. I then get a legend with the colors of the 10 groups. If I now hide 5 groups using a category filter, the color legend still shows 10 groups. Is there a setting which allows synchronization between visible data points and corresponding legend?

Thanks/Evert

Hi Evert,

currently there is no way to do this, except deleting all invisible rows, which would also remove deleted categories from the legend. It would make sense, though, to automatically remove non-visible categories from the legend.

Thomas
