- 1) Is it possible to select a row from DW project and paste it into another DW project?
- 2) And related: can I select a row in a given DW project and then paste it into a newly created "empty row".
- 3) And, also related, can I the same with columns. Here's a practical example: In a given DW project, I have a column of smiles and want to convert them to structures. So, I create a new structure column with the intent of paste in the the contents of smiles column

thanks,

Scott

- 1) & 2) with the next update you will be able to select any adjacent cells, copy their content and paste that sub-table into any other open DataWarrior window starting at any cell.
- 3) this way you may also paste SMILES strings into a new and empty column. Afterwards you may use 'Add Structures From Name...', which creates a new structure column.

Thomas

I still have not figured out how to past a from one DW project and past into an empty row of another DW project. Every time it simply past my row into a brand new DW project.

Use the table popup menu and not the main menu

Copy:

- Select some cells from the table view
- Mouse click over the table view
- Select 'Copy Selection without Header' from popup menu

Paste:

- mouse click over that table cell that shall receive the top/left clipboard content
- Select 'Paste into Table' from the popup menu

(The Paste part only works with the current development version and next official update)
