Is there a way within Datawarrior to select and hide multiple columns at once. I think this question has been asked previously in this forum, but it is not clear to me if there is a solution. I know I can hide one column at a time, but this gets pretty tedious when there are many columns. Any help would be greatly appreciated.
Thanks
Ed

not yet, but I just added these two functionalities to the table view's header popup menu:
- hide selected columns
- show all columns

In addition to that there is a table column filter that hides all columns, whose column titles don't don't contain a specified substring. This filter is part of the current beta since quite some time.

Thomas

I'm sorry, Thomas, but I don't see how this works. I don't see the new functionalities in the table view's popup menu. I've tried adding a Columns filter but no matter how I configure it, as soon as I enter a substring all row/columns become hidden. I must be doing something wrong.

Nevermind.... I figured out how to hide/show multiple columns using Macros. It works fine and makes Datawarrior much easier to use in my opinion.
Thanks!
