Hello,

When I open my existing datawarrior file the table view flashes on my screen and then disappears leaving me with a blank window. No views are open. The only things displayed on the screen are the "selected", "visible", and "total" row values at the bottom. I am able to add new views, and all of my data can be displayed in those views, but I can't find a way to get my table view back. I checked the user manual for information on opening the table view but it states

"The Table View is a mandatory view, which means that it is automatically created when you open data from any source and it cannot be closed"

Is my file damaged?

I reinstalled the newest datawarrior version and still come across this problem when opening this particular file (attached).

Any help would be appreciated!

Johanne

Hi Johanne,

thank you for sending the file. The problem was an invalid setting for the splitting proportion between data area and filter area. I updated DataWarrior allow and correct invalid values. You may download updated files from [openmolecules.org/datawarrior/dw500win.zip](http://openmolecules.org/datawarrior/dw500win.zip) or [openmolecules.org/datawarrior/dw500x.zip](http://openmolecules.org/datawarrior/dw500x.zip) (Windows or Mac/Linux).

Sorry for the inconvenience. Alternatively you may open your dwar file in a text editor and replace the line close to the end:

```
<rightSplitting="1.2609">
```

with

```
<rightSplitting="1.0">
```

That would also do it,

Thomas

I replaced the rightSplitting value and all is good to go.

Thank you so much!
