Hi DW developers,

Axial chirality is not represented by most of encoding methods, e.g. SMILES, InChi.

Axial chirality can be drawn in ChemDraw and MarvinSketch, but it seems not supported by the built-in sketcher of DataWarrior.

Can you please provide more details on this topic?

A screenshot of the 'Edit Structure of smiles' dialog box in DataWarrior. The dialog box has a toolbar on the left with various icons for editing, including 'Clear', 'Undo', 'Redo', 'Copy', 'Paste', 'Text', 'Line', 'Wedge', 'Arrow', 'Triangle', 'Square', 'Pentagon', 'Hexagon', 'Heptagon', 'Octagon', 'Benzene', and 'Aromatic'. Below the toolbar is a list of elements: C, Si, N, P, O, S, F, Cl, Br, I, H, and ?... At the bottom are 'Help' and 'Cancel' buttons. The main area of the dialog box shows a chemical structure of the same biphenyl derivative as in the previous image. The structure is colored with green for fluorine atoms, purple for the methyl groups, and red for the axial bond. The text 'unknown chirality' is written in red below the structure.

Possibly the scrutiny for P/M in simpler biphenyls differs from the one in larger systems with axial chirality when structures are drawn in the sketcher from scratch:

As a bit lengthy work-around: I redrew two structures like the one drawn by you outside DW. After their export as .mol (including 3D coordinates), they were converted with openbabel into an .sdf in common. DW apparently recognized the chirality (both.dwar, attached):

Axial chirality (indicated as M or P) is covered to some extent:

- For allenes the configuration is assigned to the central atom.
- In case of atropisomers only bi-phenyls with at least three ortho substituents are considered because of the reliably hindered rotation. Here the central bond carries the configuration information.

Thanks for your comprehensive answer.

I did not know the P/M definition before, and assigning P/M in DW really works.

However, in terms of data exchange feasibility, axial chirality can be represented in MOL format, but not in SMILES. Here you used MOL to transfer data from SDF to DW. That is a nice solution.

Thanks Thomas. Is this Axial chirality introduction covered in the online help of DW?

It will be helpful to add.

By the way, the online Help is not searchable. It would be nice to make it searchable, so that keywords like "axial chirality" will be located easier.

Thanks for the recommendation. I will look into search functionality. I know and regret that online help is always much behind the actual functionality. I could need some support here...
