How to separate the multiple values in a cell to be able to use the "Show multiple values as" option in the column header. Should we use a blank space, comma, semicolon, or : etc?

Multiple values need to be separated by either semicolon followed by a space (e.g. '5.2; 3.3; <11.1'),
they may be in multiple lines or it can be a combination of it. To use multiple lines one can either edit the value directly in DataWarrior or create a textfile with new-line encodings as '<NL>' (without the quotes).

DataWarrior allows a couple of modifiers to precede (<, >, <=, >=) or replace a numerical value (?, NaN).
Columns with numerical values and modifiers are still perceived as numerical data.

Best wishes,

Thomas
