Subject: add calculated values

Hello
Using DataWarrior 5.5.0 on a Mac, if I apply the normalize function: normalize(columvalues for instance)I get the message: Function normalize requires 2 parameters. In the help, it seems it only needs the name of the column with the values to normalize?
Many thanks
Bruno

Hi Bruno,

thank you for the message. I have fixed the issue in the current dev version. The function now really takes two parameters: value and column-name.

Thomas
