
Subject: Optional automatic protonation feature of Nitrogen in DW using EL

When creating docking scores in DW, you can select whether to protonate the ligand or not.
At the moment I am using this feature with nitrogen heterocyclic ligands.

However, when you use this feature with an EL based on docking scores, the program seems to automatically protonate the nitrogen in nitrogen-containing resulting ligands.

Is there any way to underdo this feature or at least have it as an option?

Many thanks in advance

Jon

An option to skip (de-)protonation for docking fitness in evolutionary libraries will be in the next dev version...

Thanks. Do you know approximately when the next development version will be?

I assume it is a matter of days, but I need to finish a few changes regarding conformation generation

I just deployed an update with this thing solved, but realized that the conformation generation has a fundamental design flaw, which I need to tackle. Thus, another update will follow later...

OK Many Thanks, Thomas. Approximately - are we talking days or weeks for the further update?
