Hi All,

I want to retrieve data from my oracle database using an id stored in my Datawarrior file. Is it possible to pass a identifier to the SQL somehow? I tried this but it isn't working:

```
SELECT  AVAILABILITY
FROM    availability_info
WHERE   description=$idnumber
```

I can't find the right synthax to do this. Same goes for the URL.

Thanks,

Peter

I just deployed an update that allows exactly that: Using "IN(\$IDNUMBER)" in the WHERE clause of an SQL statement does an on-the-fly replacement with all entries from the IDNUMBER columns to "IN('entry1','entry2','entry3',...)". If the idea is to merge the retrieved information with the currently open file, this still has to be done in a separate step.

Thomas

Thanks Thomas,

This already is a nice feature for me and merging works fine.

Cheers,

Peter
