Subject: Use label in Form Table

Hi thomas,

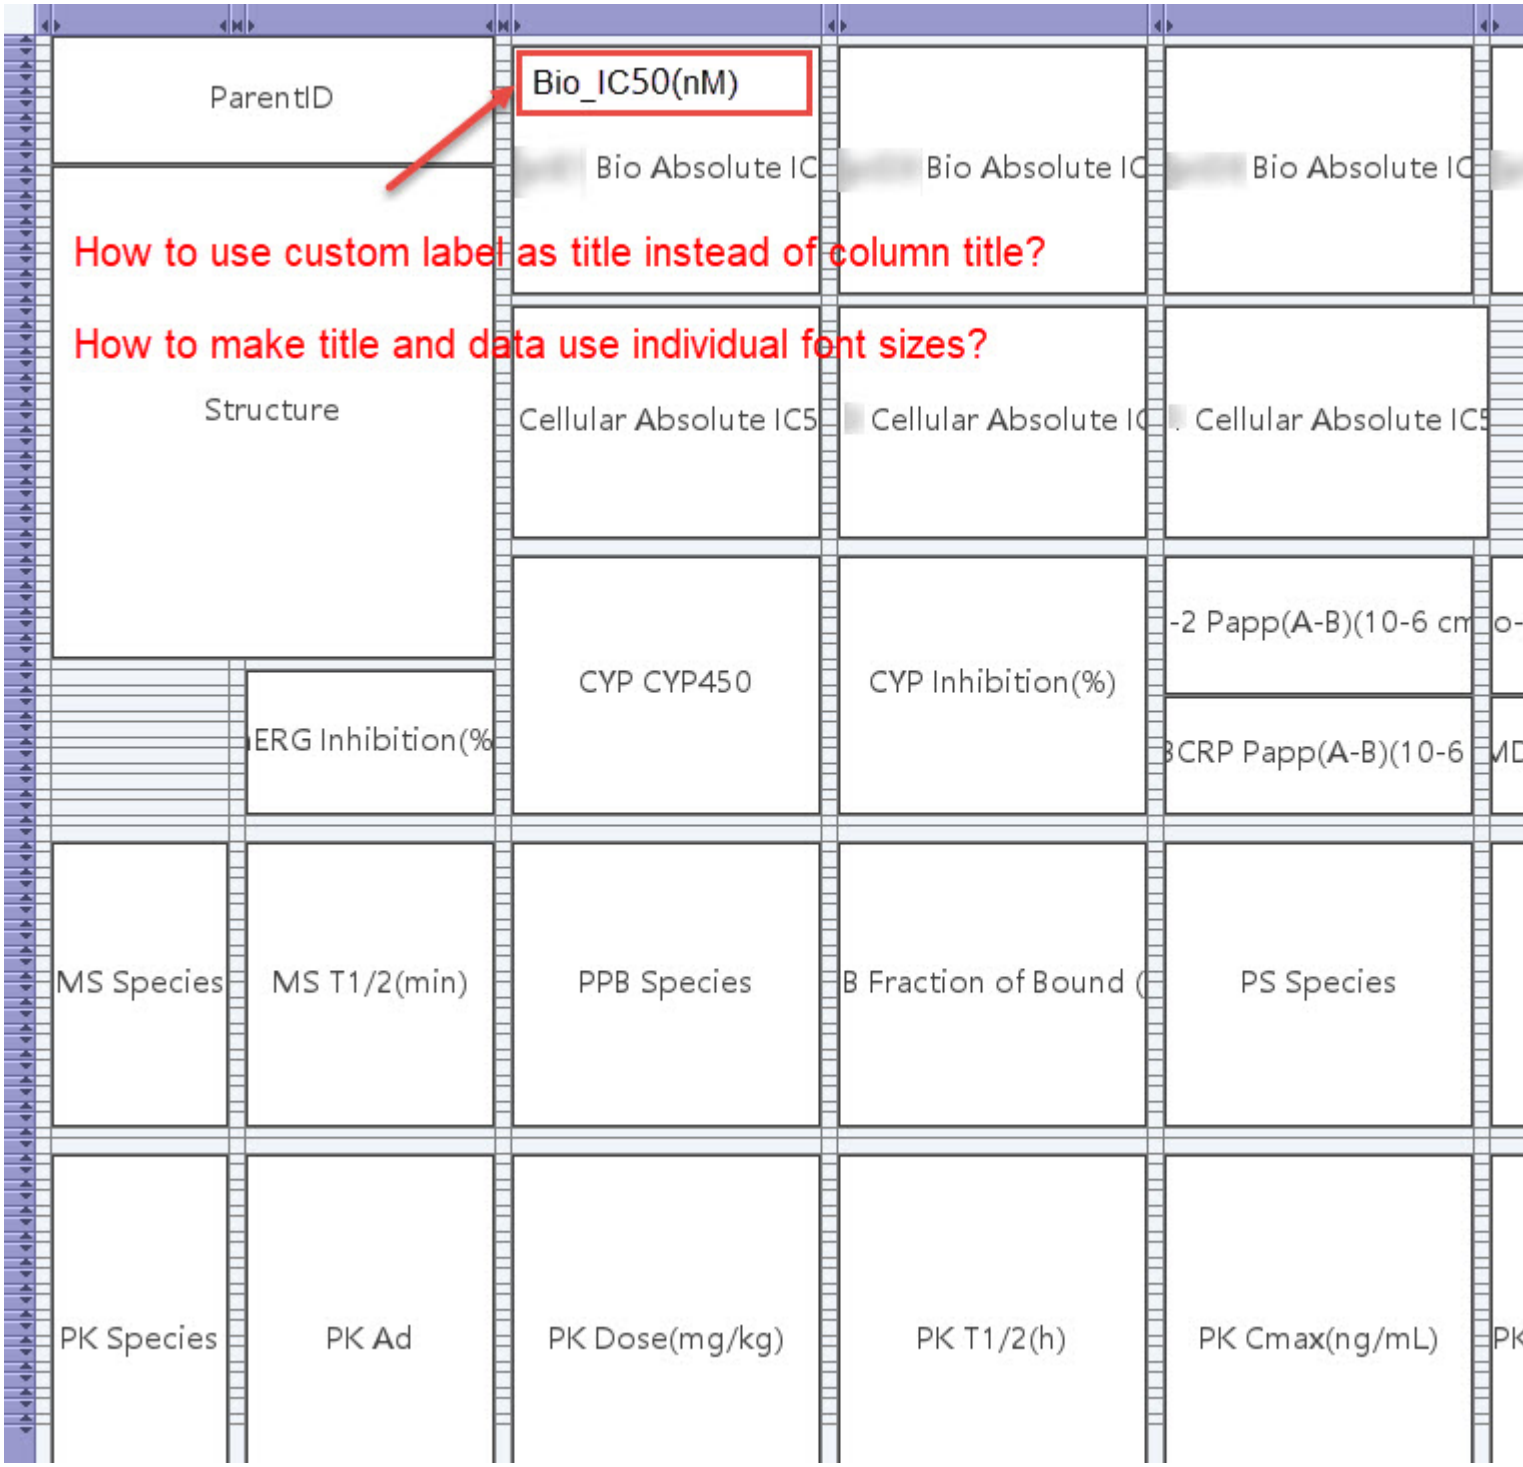

Thank you for previous modification on mergeing equivalent rows. Currently we want to make a template to display experimental data in a form table. As the title for each column was named to discriminate different assay, it is sometimes too long. If we display these column in form table, it is hardly to see all the text. So we need to decrease the fond size. However, the font size of data is decreasing simultaneously.

We wonder whether we can add custom label in the form table. Then we can display only the column data around the label in different fond size. Many thanks.

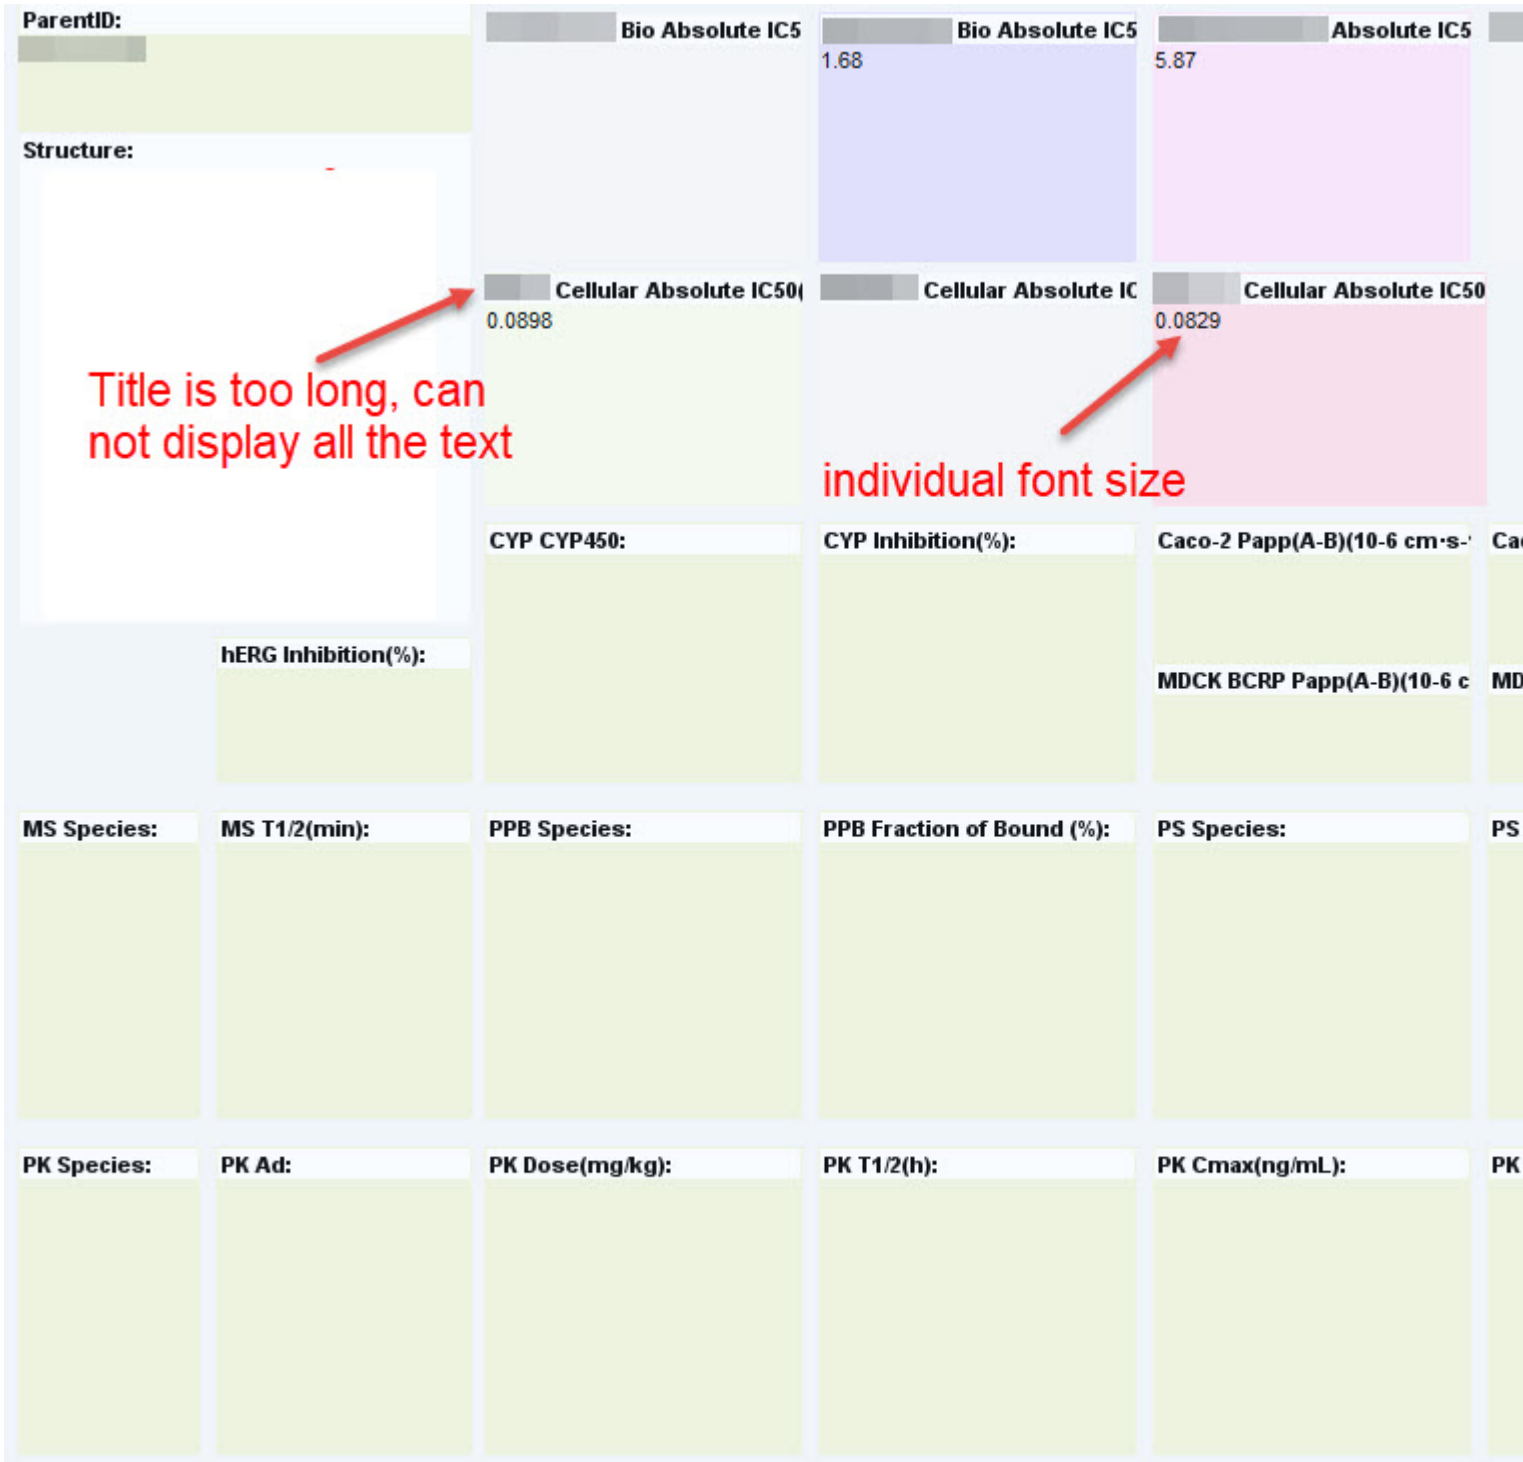

Yuan

Hi Yuan,

using different font size for title and content seems a sub-optimal solution for me for various reasons. I have now changed the form functionality such that long titles are now split into two lines if the space permits it. At least for your example, where you have plenty of vertical space, that should solve the issue. That will be in the next update.

Thomas
