
Subject: Use label in Form Table

Hi thomas,

Thank you for previous modification on mergeing equivalent rows. Currently we want to make a template to display experimental data in a form table. As the title for each column was named to discriminate different assay, it is sometimes too long. If we display these column in form table, it is hardly to see all the text. So we need to decrease the fond size. However, the font size of data is decreasing simultaneously.

We wonder whether we can add custom label in the form table. Then we can display only the column data around the label in different fond size. Many thanks.

Yuan

ParentID	Bio_IC50(nM)	Bio Absolute IC	Bio Absolute IC	Bio Absolute IC
Structure	Cellular Absolute IC5	Cellular Absolute IC	Cellular Absolute IC5	
ERG Inhibition(%)	CYP CYP450	CYP Inhibition(%)	-2 Papp(A-B)(10-6 cm	o-
MS Species	MS T1/2(min)	PPB Species	B Fraction of Bound (PS Species
PK Species	PK Ad	PK Dose(mg/kg)	PK T1/2(h)	PK Cmax(ng/mL)

How to use custom label as title instead of column title?

How to make title and data use individual font sizes?

Hi Yuan,

using different font size for title and content seems a sub-optimal solution for me for various reasons. I have now changed the form functionality such that long titles are now split into two lines if the space permits it. At least for your example, where you have plenty of vertical space, that should solve the issue. That will be in the next update.

Thomas
