Subject: Sequoia 15.0 issues Mac (intel)- DataWarrior (6.1.0) won't open

Hello all,
    I have been using DataWarrior for about a year now and it has become a vital part of my research due to its wide capabilities. Recently, upon downloading the newest MacOS Sequoia 15.0, I cannot open DataWarrior and I am not sure as to why. The core issue seems to be related to code signing (termination reason: code signing 4 launch constraint violation). Also in the incident report it mentions the exception type (exc_crash) and the signal (sigkill-code signature invalid). Moreover, it appears that there is an issue with the dynamic loader (dyld) [dyld path missing] and the main executable path. Also, in case my Mac version is needed I am currently running DataWarrior on a MacBookPro 16,3. Lastly, I have tried changing permissions, allowing access to DataWarrior through privacy controls, and redownloading the app with no avail.

Any help would be greatly appreciated! Thank you in advance!

****Update 10/07/24 it appears that if you right click on the app and select 'Show Package Contents' and select the 'Contents' folder and select the 'MacOS' folder and then select the Unix executable file (exec) for 'DataWarrior' it opens up the app. Hope this helps any others with the same problem.

I just updated from 14 to Sequoia 15.0.1 on a MacBook Air M2. DataWarrior 06.02.05 starts as usual no matter, whether I double click a document icon or the application icon. Possibly, the issue was fixed with Sequoia 15.0.1...

On github us was suggested to remove extended File attributes with

xattr -c /Applications/DataWarrior.app
