Hello,

it seems there is an error in "PathFp" descriptor calculation, where some '1' bits are outputted as '0' bits

Looking at the code (4.5.1 version), the createDescriptor() method in com.actelion.research.chem.descriptor.DescriptorHandlerPFP51 2 class, there seem to be an error during the translation from java.util.BitSet into an int[] array, where i and j variables appear to be switched in line 60 of DescriptorHandlerPFP512.java file, where:

```
if (bitset.get(32 * i + j))
```

should be:

```
if (bitset.get(32 * j + i))
```

Greetings.
